KCC 4749.2 K.C. 16,858.2 PATENT

1. Rejection of Claims 1, 11, and 14-20 Under 35 U.S.C. \$103(a)

Reconsideration is requested of the rejection of claims 1, 11, and 14-20 under 35 U.S.C. §103(a) as being unpatentable over DE 1204777 in view of D'Augustine, et al. (U.S. 6,416,779).

Claim 1 is directed to an exoprotein inhibitor for inhibiting production of exoproteins from Gram positive bacteria in and around the vagina. The exoprotein inhibitor comprises a non-absorbent substrate for insertion into a vagina being selected from the group consisting of a non-absorbent incontinence device, a barrier birth control device, a tampon applicator, and a douche. The non-absorbent substrate has deposited thereon an effective amount of a first active ingredient having the general formula

wherein R^1 is selected from the group consisting of H, $\frac{1}{2}$ COR⁵ - OR⁵, - R⁶C(O)H, - R⁶OH, - R⁶COOH, - C(O)NH₂,

PAGE 3/34 * RCVD AT 8/17/2006 4:00:34 PM [Eastern Daylight Time] * SVR:USPTO-EFXRF-2/15 * DNIS:2738300 * CSID:3142314342 * DURATION (mm-ss):11-08

and NH₂ and salts thereof; R⁵ is a moneyalent saturated or unsaturated aliphatic hydrocarbyl moiety; R⁶ is a divalent saturated or unsaturated aliphatic hydrocarbyl moiety; R⁷ is a trivalent saturated or unsaturated aliphatic hydrocarbyl moiety; R⁸ is a monovalent substituted or unsubstituted saturated or unsaturated aliphatic hydrocarbyl moiety which may or may not be interrupted with hetero atoms; R², R³, and R⁴ are independently selected from the group consisting of I, OH, COOH, and -C(O)R⁹; R⁹ is hydrogen or a monovalent saturated or unsaturated aliphatic hydrocarbyl moiety. The first active ingredient is effective in inhibiting the production of exoproteri from Gram positive bacteria.

DE 1204777 ('777) discloses a method of increasing the bactericidal action of hexachlorophene. The method includes combining hexachlorophene with 1% (by weight) to 95% (by weight) benzoic acid, aniline, or penzamide. Specifically, '777 discloses that the addition of benzamide, in a concentration of from 50% (by weight of the mixture with hexachlorophene) to 91% (by weight of the mixture with hexachlorophene), increased the germicidal activity against Staphylocaccus aureus by 37% to 100% and at the same time, accelerated the dilling action. Additionally, benzoic acid and aniline showed a synergistic bactericidal effect when combined with hexachlorophene.

As noted by the Office in the Office action dated November 28, 2005, '777 fails to disclose a non-absorbent substrate for insertion into the vagina peing selected from the group consisting of a non-absorbent incontinence device, a barrier birth control device, a tampon applicator, and a douche. In an

attempt to find each and every element of claim 1 as required by the M.P.E.P. for a determination of prima facie obviousness, the Office cites the D'Augustine et al. reference for combination with '777.

D' Augustine et al. disclose devises, methods, and compositions for treating vaginal funcal, bacterial, viral, and parasitic infections by intravaginal or transvaginal administration of therapeutic and/or palliative antifungal, antibacterial, antiviral or parasitic fall drugs to the vagina or to the uterus. Specifically, a device such as a tampon, tampon-like device, vaginal ring, pessary, carvical cup, vaginal sponge, intravaginal tablet, or intravaginal suppository. delivers the drug, which can be in the form of a paste, cream, ointment, microcapsule, solution, power, or gel having a sufficient thickness to maintain prolonged vaginal epithelium and mucosa contact. In one embodiment, the drug can be incorporated into a cream, lotion, foat, paste, ointment, or gel which can be applied to the vagina using an applicator.

In order for the Office to show a prima facie case of obviousness, M.P.E.P. §2143 requires that the Office must meet three criteria: (1) the prior art references must teach or suggest all of the claim limitations; (2) there must be some suggestion or motivation, either in the references themselves or in the knowledge generally available to one of ordinary skill in the art, to combine the references, and (3) there must be some reasonable expectation of success. The Office has failed to

¹ D' Augustine et al. at column 18, lines 24-26.

meet its burden under (2) above, as there is no motivation or suggestion to combine the 1777 and D' Augustine et al. references to arrive at Applicants' claim 1.

As noted in M.P.E.P. \$2142, in establishing obviousness, the Office must show references that pach all of the claimed limitations along with some motivation or suggestion, either in the references themselves or in knowledge generally available to one skilled in the art, to combine the references and arrive at the claimed subject matter; 2 The mere fact that the references can be combined to arrive at the claimed subject matter does not render the resultant combination obvious, unless the prior art also suggests the desirability of the combination. In re Mill, 916 F.2d 680, 16 USPQ2d 1430 (Fed. Ci 1990). A close reading of the cited references clearly indicates that one skilled in the art would not have been so motivated and, without Applicants' disclosure as a blueprint which the Office had the benefit of utilizing), such a combination of the '777 and D' Augustine et al. references would not have been made.3

²As further set forth in M.P.E.P. §2143,01, obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either explicitly or implicitly in the reference itself, or in the knowledge generally available to one of ordinary skill in the art.

³M.P.E.P. §2142 further provides that in order to reach a proper determination under 35 U.S.C. §103(a) the Examiner must step backward in time and into the shoes were by the hypothetical "person of ordinary skill in the art" when the invention was unknown and just before it was made. Knowledge of Applicants'

The Office asserts that, as the 77 reference teaches benzamide as an effective inhibitor of Staphylococcus and

disclosure must be put aside in reaching this determination, yet kept in mind in order to determine the differences." The tendency to resort to "hindsight" based upon Applicants' disclosure is often difficult to avoid due to the very nature of the examination process. However, as stated by the Federal Circuit, impermissible hindsight must be avoided and the legal conclusion must be reached on the base of the facts gleaned from the prior art. Grain Processing Corp. v. American-Maize-Products, Co., 840 F.2d 902, 904 (Fed Cir. 1988).

It is noted that the Office states that the '777 reference discloses benzamide as an inhibitor of Staphylococcus.

Applicants respectfully note that the 777 reference discloses using hexachlorophene and benzamide topether as an antibacterial agent and not as an inhibitor of Stappiclococcus. Further, it is worth noting at this time that the first active ingredient used in the exoprotein inhibitor of claim i of the present invention is not acting as an antibacterial agent as apparently understood by the Office. As mentioned in Applicants' specification, the first active ingredient acts to inhibit the production of exoproteins from Gram positive bacteria, but does not seek to kill the bacteria as the killing of bacteria is non-selective and the "good" bacteria needed to maintain a healthy vagina would also be killed. Thus, the non-selective killing of bacteria could actually be very harmful to the vagina and could cause serious health problems. This is significant. The first active ingredient as claimed in claim of the present invention actually seeks not to act as an antibetterial agent as claimed actually seeks not to act as an antibapterial agent as claimed by the Office, but seeks to only prevent the production of potentially harmful by-products of barteria, while allowing the bacteria to live. It is also noted that the '777 reference does not suggest or disclose that a composition having the general formula of the first active ingredient of claim 1 can act in such a manner.

In the Office action dated May 17, 2006, the Office states that Applicants' arguments regarding thibiting the exoprotein production without killing the bacterial are not persuasive as

D'Augustine discloses effective delivery of desired drugs through non-absorbent vaginal devices it would have been obvious for one skilled in the art at the time of the instant invention to add the benzanide of the 777 reference to the non-absorbent devices of D'Augustine for inhibiting bacterial infections in the vaginal area. With all due respect, Applicants submit that this is not a convincing line of reasoning as to why the combination of these references would have been obvious to one skilled in the art at the time of the invention. Specifically, why would one skilled in the art pick the composition of the '777 reference over all of the other non-toxic, antibacterial compositions in the art, particularly when the D'Augustine et al. provide numerous suitable antibacterial compositions to use with their non-absorbent devices and do not point to any need for alternatives?

D' Augustine et al. simply teach pompositions that can be

the instant claims do not exclude killing of the bacteria while inhibiting exoprotein production. Further, even though the references cited recognize antibacterial effect, it is to be noted that while the ultimate effect of an antibacterial agent is killing the bacteria, such an effect includes inhibiting proteins. With all due respect, Applicants assert that the Office is combining the first and second prongs of MPEP §2143, that of teaching each and every limits in and providing motivation or suggestion to modify/consine the references. As '777 teaches the use of benzamide as an antibacterial (and not as an inhibitor of exoprotein production as required in claim 1), one skilled in the art, looking to the '777 reference, would not and could not be motivated to combine the benzamide of '777 with the absorbent devices of D'Augustine et al. This motivation prong is separate and distinct from the prong

used as antibacterials to reat bacterial infections of the vagina and devices for delivering the pompositions; and even provide several commercially acceptable antibacterial compositions. The D' Augustine et al reference fails to provide a reason why one skilled in the art would choose another antibacterial over those lasted in that D' Augustine et al. reference or disclosed elsewhere in the art. The '777 reference is directed to improving the bacteric hal action of hexachlorophene by combining hexachlorophene with other antibacterial compounds, in one embodiment, with benzamide in a pH range of 6.0 to 6.8. No where in the '777 reference is it disclosed that the antibacterial compesition including benzamide alone is effective in the treatment of vaginal fungal, bacterial, viral, and paragitic infections in and around the vagina. Specifically, the '777 referance discloses that the amides, such as benzamide, alone ordinarily have little or no germicidal or fungicidal properties. As such, one reading the '777 reference would not and could not be motivated to use benzamide alone for inhibiting S. aurais.

Furthermore, while D'augustine discloses the use of numerous antimicrobials and antifungals, no where in the D'Augustine reference is it disclosed to use hexachlorophene as an antibacterial or antifungal. As such, why would one skilled in art, reading the '777 reference, believe benzamide would provide a synergistic effect when complined with the antibacterials of D'Augustine? It appares the Office is

requiring the cited reference to teach or suggest each and every

suggesting that benzamide would be experted to provide improved germicidal and fungicidal properties the all antimicrobial agents. One skilled in the art simply would not and could not make this assumption with a reasonable expectation of success.

Furthermore, in the Response section of the Office action dated May 17, 2006, the Office states hat "Applicants' arguments are not persuasive because 1077 suggests a synergistic increase in the antibacterial activity by the addition of compounds such as benzamide, aniline, atc., which is a very small group of compounds as opposed to [Applicants'] argument that '777 suggests numerous other communds."5 With all due respect, Applicants note to the Office that, as discussed above, Applicants' argued that there was no wativation to combine the references as the Office has failed to provide a convincing line of reasoning why one skilled in the am would be motivated to choose another antibacterial over the jumerous other antibacterials listed in the D Augustine al. reference. Specifically, the D'Augustine et al. Hiference discloses antibacterials such as metronidazole, clintamycin, ampicillin, amoxicillin, tetracycline, and doxycymine, as well as numerous other anti-viral, anti-fungal, and anti-trichomona agents.6

Furthermore, the D'Augustine et . reference is directed to treating infections such as Haemop llus vaginitus and Cornebacterium vaginitis caused by an arobic bacteria such as Gardnerella vaginalis or Mycoplasma hadinus. No where in the

limitation of the claims.

⁵ Office action dated May 17, 2006 at tage 3. ⁶ See the D'Augustine et al. reference at column 10, lines 16-31.

D'Augustine et al. reference are infertions caused by Staphylococcus aureus taught or suggested. As such, one skilled in the art would not, and could not, is motivated to use the anti-bacterials of '777, which, as shown in every working Example of '777, are effective against Staphylococcus aureus, over the anti-bacterials discussed in the D'Augustine et al. reference directed to treating the infections caused by Gardnerella vaginalis or Mycoplasma haminus.

As such, one skilled in the art sould not, and could not, be motivated to use the compounds of 1777 over any other antibacterial compounds in the intraveginal devices of D' Augustine et al. to arrive at each and every limitation of Applicants' claim 1.

With all due respect, it appears what the Office has used impermissible hindsight analysis and econstruction when combining the '777 and D'Augustine, et al. references. There is simply no motivation or suggestion to combine the '777 reference with the D'Augustine reference to arrive at each and every limitation of claim 1.

As there is no motivation or suggestion to combine the '777 and D' Augustine et al. references to arrive at each and every limitation of claim 1, claim 1 is patentable over '777 in view of D'Augustine et al.

Claims 11 and 14-20 depend directly from claim 1. As such, claims 11 and 14-20 are patentable over '777 in view of D'Augustine et al. for the same reasons as claim 1 set forth above, as well as for the additional elements they require.

2. Rejection of Claims 1, 11, 14-20, and 22-32 Under 35 U.S.C. §103(a)

Reconsideration is requested of the rejection of claims 1, 11, 14-20, and 22-32 under 35 U.S.C. 5103(a) as being unpatentable over Syverson et al. (U.S. 5,612,045) in view of DE 1204777('777).

Claim 1 is discussed above. Addinionally, the '777 reference is discussed above.

As discussed above, 1777 fails the disclose a non-absorbent substrate for insertion into the vaginal being selected from the group consisting of a non-absorbent incontinence device, a barrier birth control device, a tampod applicator, and a douche. Additionally, the 1777 reference fail to disclose ethers as a second active ingredient as required claims 22-32. attempt to find each and every element of claim 1 and further each and every element of claims 22-3 the Office attempts to combine 5,612,045 ('045) with the '77 reference. Specifically, the Office states that it would have been obvious for one of ordinary skill in the art to combine the benzamide compound of '777 with the toxin inhibiting ether impounds of '045 and apply the compounds to the feminine hygiene products of '045. Furthermore, the Office states that while '045 does not disclose the specific non-absorbent articles of claim 1, absent any unexpected results with respect to the mon-absorbency of the

Applicants respectfully note that in the Office action dated November 28, 2005, claim 32 was found to contain allowable subject matter but was objected to as being dependent upon a rejected base claim.

articles, it would have been within the scope of a skilled artisan to use either non-absorbent of absorbent articles for incorporating the compounds of '777 and '045.

As noted above, a prima facie call of obviousness under M.P.E.P. §2143 requires that the Office must meet three criteria: (1) the prior are reference must teach or suggest all of the claim limitations; (2) there must be some suggestion or motivation, either in the references premselves or in the knowledge generally available to one ordinary skill in the art, to combine the references, and (there must be some reasonable expectation of success. The Office has failed to meet its burden under (1) and (2) about, as the cited references alone or in combination fail to show an exoprotein inhibitor comprising a non-absorbent substrate and there is no motivation or suggestion to combine and/or modifie the '777 and '045 references to arrive at Applicants' claim 1.

As noted above, neither of the cated references expressly teaches a non-absorbent substrate selected from the group consisting of non-absorbent incontinente device, a barrier birth control device, a tampon applicator, and a douche for use in inhibiting exoprotein production in and around the vagina. While Applicants agree with the Office that the '045 reference teaches absorbent articles including ampounds to inhibit exoprotein production, Applicants assent that no where in '045 it is suggested or taught that the same compounds could be used in the same manner on a non-absorbent hubstrate to inhibit exoprotein production.

In the Response section of the Office action dated May 17,

2006, the Office states that the '045 peference teaches that the compounds effective against S. aureus can be used on absorbent as well as non-absorbent fibers of the devices, such as covers or wrappers of the vaginal devices in unding tampons. due respect, Applicants disagree with the Office's interpretation of the '045 reference. A close reading of the '045 references supports that the absorbent devices, such as a tampon, may be made of various fiber plends including both absorbent and nonabsorbent fibers. Further these absorbent devices may or may not have a suitable cover or wrapper. No where, however, is it taught or suggested in the '045 reference to use the compounds on the cover or mapper of the tampon or solely on any non-absorbent substrate As such, the Office has not shown a convincing line of reasoning for one skilled in the art to use the compounds of the '045 ference on non-absorbent substrates to inhibit exoprotein production.

Furthermore, even if one skilled in the art, reading '045, would be motivated to use the compounts of '045 on a non-absorbent substrate (which Applicants essert they would not be so motivated), there is no motivation or suggestion to combine the cited references and arrive at each and every limitation of claim 1.

As noted above, '045 simply teach ether compositions that can be used with absorbent articles such as catamenial tampons to inhibit the exoproteins of Gram positive bacteria.

Specifically, '045 is directed to solving the problem of toxic shock syndrome, which is caused by TSTF-1, an exoprotein

produced by S. aureus found in the value. The inventors of '045 found that their ether compounds puld be used to inhibit exoprotein produced by S. aureus without harming the natural flora of the vagina. No where in the 045 reference is killing of S. aureus bacteria taught or suggetted as a desired method of controlling exoprotein production. Am such, one skilled in the art would not, and could not, be motilited to use the compounds of the '777 reference, specifically, the combination of hexachlorophene and benzamide, which is shown in the '777 reference to kill S. aureus, in the approbent devices of '045, specifically designed to inhibit exophitein production by S. aureus without killing the bacteria.

Additionally, while the '045 reference generally teaches that the ether compositions may employ additional active materials such as supplementary antimerobials, anti-parasitic agents, antipruritics, astringents, latal anaesthetics, or antiinflammatory agents of for dombination therapy, no where in the '045 reference is it taught or suggested to use an antibacterial to kill S. aureus bacteria. As such, the '045 reference fails to provide a reason why one skilled in the art would choose benzamide disclosed in '777 as the additional antibacterial over any of the other numerous antibacterials disclosed elsewhere in the art.

Additionally, as noted above, the 777 reference is directed to improving the pactericida action of hexachlorophene

⁸ See U.S. 5,612,045 at column 2, line 6-11.

See U.S. 5,612,045 at column 3, lines 1-6.
 U.S. 5,612,045 at column 5, lines 21,27.

by combining hexachlorophene with other antibacterial compounds, specifically, in one embodiment, with tenzamide. No where in the '777 reference is it disclosed to use the antibacterial composition, specifically benzamide, for the inhibition of exoprotein production in and around the vagina. Furthermore, no where is it disclosed in '777 that the antibacterial benzamide would be safe to use internally in humans. As such, one skilled in the art would not, and could not, the been motivated to use the '777 composition on an absorbent substrate such as a catamenial tampon, which would inevitably, and unavoidably, contact the sensitive mucosal membrane of the inner vagina.

In the instant Office action, the Office states that if Applicants' argument is that benzamid would unavoidably and inevitably harm the sensitive mucosal membrane of the inner vagina, then the same argument should pold true for the claimed invention because the instant invention also employs the same benzamide. With all due respect, it prears that the Office has misunderstood Applicants' argument. The Applicants' are not asserting that benzamide is harmful to the sensitive mucosal membrane of the inner vagina. Specifically, Applicants' argue that as no where in the '777 reference is it taught or suggested that benzamide or any of its antibact tal compounds are suitable for use in the vagina, without using the Applicants' disclosure as a blueprint (which, as inted above, such use has been ruled by the Federal Circuit as ting improper hindsight reconstruction), there would be no monwation or suggestion to use benzamide in the absorpent devices of '045. As such, there is simply no motivation or suggestion to combine the '045

reference with the '777 reference to intrive at each and every limitation of claim 1.

As no where in the cited references, is an exoprotein inhibitor comprising a non absorbent substrate as required in claim 1 taught or suggested and further, there is no motivation or suggestion to combine the '045 and '077 references to arrive at each and every limitation of claim 1; claim 1 is patentable over '045 in view of '777.

Claims 11, 14-20, and 22-32 depend directly or indirectly from claim 1. As such, claims 11, 14-20, and 22-32 are patentable over '045 in view of '777 the the same reasons as claim 1 set forth above, as well as for the additional elements they require.

3. Rejection of Claims 1, 11, 44-20, and 48-55 Under 35 U.S.C. §103(a)

Reconsideration is requested of the rejection of claims 1, 11, 14-20, and 48-55 under 35 U.S.C. 103(a) as being unpatentable over Syverson et al. (U.S. 5,685,872) in view of DE 1204777('777).

Claim 1 is discussed above. Add inionally, the '777 reference is discussed above.

As discussed above, '777 fails to disclose a non-absorbent substrate for insertion into the vagira being selected from the group consisting of a non-absorbent importance device, a barrier birth control device, a tampon applicator, and a douche.

Additionally, the '777 reference fail to disclose active agents having the general formula:

wherein R17, inclusive of the carbonyl farbon, is an alkyl group having 8 to 18 carbon atoms, and R18 and R19 are independently selected from hydrogen or an alkyl grap having from 1 to about 12 carbon atoms which may or may not substituted with groups selected from ester groups, ether groups, amine groups, hydroxyl groups, carboxyl groups, carboxyl sales sulfonate groups, sulfonate salts, and mixtures thereof a second active ingredient as required in claims 48-5 In an attempt to find each and every element of claim 1 and further each and every element of claims 48-55, the Office autempts to combine 5,685,872 ('872) with the 777 reference. Specifically, the Office states that it would have been byious for one of ordinary skill in the art to combine the benzamide compound of '777 with the toxin inhibiting compounds of '872 and apply the compounds to the feminine hygiene profits of '872. Furthermore, the Office states that while '872 does not disclose the specific non-absorbent articles of claim 1, absent any unexpected results with respect to the non-absorbency of the articles, it would have been within the scope of a skilled artisan to use either non-absorbent of absorbent articles for incorporating the compounds of '777 and '872.

Similar to the arguments made above, the Office has again failed to meet its burden under (1) and (2) of M.P.E.P. §2143 for a prima facie case of obviousness is the cited references alone or in combination fail to show an exoprotein inhibitor comprising a non-absorbent substrate and there is no motivation or suggestion to combine and/or modificate '777 and '872 references to arrive at Applicants' claim 1.

As noted above, neither of the cited references expressly teaches a non-absorbent substrate selected from the group consisting of non-absorbent incontine redevice, a barrier birth control device, a tampon applicator, it a douche for use in inhibiting exoprotein production in a claround the vagina. While Applicants agree with the Office that the '872 reference teaches absorbent articles including impounds to inhibit exoprotein production, Applicants assert that no where in '872 it is suggested or taught that the same compounds could be used in the same manner on a non-absorbent substrate to inhibit exoprotein production.

As in the rejection over the '77 reference in combination with the '045 reference, the Office reponds to Applicants' arguments by initially stating that the '872 reference teaches that the compounds effective against aureus can be used on absorbent as well as non-absorbent fibers of the devices, such as covers or wrappers of the vaginal spices including tampons. Similar to above, Applicants again disgree with the Office's interpretation of the reference. Similar to the '045 reference, a close reading of the '872 reference supports that the absorbent devices, such as a tampon, so be made of various

fiber blends including both absorbent and nonabsorbent fibers.

Further, these absorbent devices may at may not have a suitable cover or wrapper. No where, however, is it taught or suggested in the '872 reference to use the compands on the cover or wrapper of the tampon or solely on any non-absorbent substrate. As such, the Office has nor shown a carringing line of reasoning for one skilled in the art to use the compounds of the '872 reference on non-absorbent substrates to inhibit exoprotein production.

Furthermore, even if one skilled in the art, reading '872, would be motivated to use the compounts of '872 on a non-absorbent substrate (which Applicants assert they would not be so motivated), there is no motivation or suggestion to combine the cited references and arrive at each and every limitation of claim 1.

'872 simply teach nitrogen containing compounds having the general formula:

wherein R¹⁷, inclusive of the carbonyl carbon, is an alkyl group having 8 to 18 carbon atoms, and R¹⁸ are independently selected from hydrogen or an alkyl group having from 1 to about 12 carbon atoms which may or may not be substituted with groups selected from ester groups, ether groups, amine groups, hydroxyl

groups, carboxyl groups, carboxyl sal sulfonate groups, sulfonate salts, and mixtures thereof that can be used with absorbent articles such as catamenial campons to inhibit the exoproteins of Gram positive bacteria Specifically, '872 is directed to solving the problem of to shock syndrome, which is caused by TSST-1, an exprotein princed by S. aureus found in the vagina. 11 The inventors of 'and found that their compounds could be used to inhibit experien production by S. aureus without altering the natural firma found in the vaginal area. 12 No where in the '872 reference is killing of S. aureus bacteria taught or suggested as a desired method of controlling exoprotein production. As such, one stilled in the art would not, and could not, be motivated to use the compounds of the '777 reference in the absorbent devices of '872, specifically designed to inhibit exoprofein production by S. aureus without killing the bacteria.

Additionally, while the '872 reference generally teaches that their nitrogen containing compound may employ additional active materials such as supplementar, antimicrobials, anti-parasitic agents, antipruritics, astricents, local anaesthetics, or anti-inflammatory agents 13 for combination therapy, no where in the '872 reference is it taught or suggested to use an antibatterial to 11 S. aureus bacteria. As such, the '872 reference fails to provide a reason why one skilled in the art would choose benza the disclosed in '777 as

¹¹ See U.S. 5,685,872 at column 2, lires 7-12.
12 See U.S. 5,685,872 at column 3, lires 4-9.
13 U.S. 5,685,872 at column 5, lines 35 41.

the additional antibacterial over any to the other numerous antibacterials disclosed elsewhere in the art.

antibacterials disclosed e sewhere in the art.

As noted above, the '777 reference is directed to improving the bactericidal action of hexachloromene by combining hexachlorophene with other antibacter at compounds, specifically, in one embodiment, with tenzamide. No where in the '777 reference is it disclosed to use the antibacterial composition, specifically denzamide, for the inhibition of exoprotein production in and around the vagina. Furthermore, no where is it disclosed in '777 that the intibacterial benzamide would be safe to use internally in humans. As such, one skilled in the art would not, and could not, are been motivated to use the '777 composition on an absorbent postrate such as a catamenial tampon, which would inevited y, and unavoidably, contact the sensitive mucosal membrane of the inner vagina.

In the instant Office action, the Office states that if Applicants' argument is that benzamid would unavoidably and inevitably harm the sensitive mucosal ambrane of the inner vagina, then the same argument should fold true for the claimed invention because the instant invention also employs the same benzamide. With all due respect, it spears that the Office has misunderstood Applicants' argument. Applicants' are not asserting that benzamide is harmful to the sensitive mucosal membrane of the inner vagina. Specifically, Applicants' argue that as no where in the '777 reference is it taught or suggested that benzamide or any of its antibact real compounds are suitable for use in the vagina, without the use of Applicants' disclosure as a blueprint (which, as reled above, the Federal

Circuit has ruled such use as imprope inindsight reconstruction), there would be no modification or suggestion to use benzamide in the absorbent device of '872. As such, there is simply no motivation or suggestion to combine the '872 reference with the '777 reference to trive at each and every limitation of claim 1.

As no where in the cited references, is an exoprotein inhibitor comprising a non-absorbent expertate as required in claim 1 taught or suggested and further there is no motivation or suggestion to combine the '872 and '777 references to arrive at each and every limitation of claim 1 claim 1 is patentable over '872 in view of '777.

Claims 11, 14-20, and 48-55 depet directly or indirectly from claim 1. As such, claims 11, 14 to, and 48-55 are patentable over '872 in view of '777 are the same reasons as claim 1 set forth above, as well as for the additional elements they require.

4. Rejection of Clasms 56-62 User 35 U.S.C. §103(a)

Reconsideration is requested of the rejection of claims 56-62 under 35 U.S.C. §103(a) as being undertable over Syverson et al. (U.S. 5,618,554) in view of DE 1204777('777).

Claims 56-62 depend indirectly fith claim 1 and further require a second active ingredient haring the general formula:

wherein R²⁰ is an alkyl group having from about 8 to about 18 carbon atoms and R²¹ and R² are independently selected from the group consisting of hydrogen and alky groups having from 1 to about 18 carbon atoms and which can him one or more substitutional moieties selected from the group consisting of hydroxyl, carboxyl, carboxyl salts an imidazoline. Claim 1, which is discussed above, has not been rejected under 103(a) as being unpatentable over 5, 18,554 ('54) in view of '777. As such, claims 56-62, which depend from k aim 1, are patentable for the same reasons as claim 1, as will as for the additional elements they require.

The '777 reference, which is discussed above, fails to disclose a non-absorbent substrate for insertion into the vagina being selected from the group consisting of a non-absorbent incontinence device, a barrier birth strol device, a tampon applicator, and a douche. Additional to the '777 reference fails to disclose active agents having the general formula:

wherein R^{20} is an alkyl group having from about 8 to about 18 carbon atoms and R^{21} and R^{2} are independently selected from the group consisting of hydrogen and alkyl groups having from 1 to about 18 carbon atoms and which can him one or more

substitutional moieties selected from the group consisting of hydroxyl, carboxyl, carboxyl salts an imidazoline as a second active ingredient as required in clair 56-62. In an attempt to find each and every element of claims -62, the Office attempts to combine 5,618,554 ('554) with the 7 reference. Specifically, the Office states that would have been obvious for one of ordinary skill in the art combine the benzamide compound of '777 with the toxin inhibiting compounds of '554 and apply the compounds to the feminine h ene products of '554. Furthermore, the Office states that wile '554 does not disclose the specific non-absorbent articles of claim 1, absent any unexpected results with respect to the con-absorbency of the articles, it would have been within the scope of a skilled artisan to use either non-absorbent of absorbent articles for

incorporating the compounds of '777 and '554.

The cited references alone or in tombination fail to show an exoprotein inhibitor comprising a pri-absorbent substrate and there is no motivation or suggestion combine and/or modify the '777 and '554 references to arrive at Applicants' claims 56-62. As such, the Office has failed to make a prima facie case of obviousness under M.P.E.P. §2143.

As noted above, neither of the cared references expressly teaches a non-absorbent substrate selected from the group consisting of non-absorbent incontine device, a barrier birth control device, a tampon applicator, it a douche for use in inhibiting exoprotein production in a around the vagina. While Applicants agree with the Office hat the '554 reference teaches absorbent articles including pounds to inhibit

exoprotein production, Applicants asset that no where in '554 it is suggested or taught that the same compounds could be used in the same manner on a non-absorbent substrate to inhibit exoprotein production.

In the Response section of the Office action dated May 17, 2006, the Office states that the '554 ference teaches that the compounds effective agains S. aureus tan be used on absorbent as well as non-absorbent fibers of the devices, such as covers or wrappers of the vaginal devices in Liding tampons. Similar to above, Applicants again disagree with the Office's interpretation of the reference. Similar to the '045 reference, a close reading of the '55% reference poorts that the absorbent devices, such as a tampon, to be made of various fiber blends including both absorbent and nonabsorbent fibers. Further, these absorbent devices may be may not have a suitable cover or wrapper. No where, however, is it taught or suggested in the '554 reference to use the compared on the cover or wrapper of the tampon or solely on an non-absorbent substrate. As such, the Office has not shown a carringing line of reasoning for one skilled in the art to use the compounds of the '554 reference on non-absorbent substrates to inhibit exoprotein production.

Furthermore, even if one skilled in the art, reading '554, would be motivated to use the compount of '554 on a nonabsorbent substrate (which Applicants sert they would not be so motivated), there is no motivation suggestion to combine the cited references and arrive at east and every limitation of claims 56-62.

'554 simply teaches nitrogen confining compounds having the general formula:

wherein R^{20} is an alkyl group having $\mathbf{1}$ about 8 to about 18 carbon atoms and R21 and R2 are indep ently selected from the group consisting of hydrogen and alky groups having from 1 to about 18 carbon atoms and which can have one or more substitutional moieties selected from the group consisting of hydroxyl, carboxyl, carboxyl salts and midazoline that can be used with absorbent articles such as samenial tampons to inhibit the exoproteins of Gram positive bacteria. Specifically, '554 is directed to soling the problem of toxic shock syndrome, which is caused by TS 1, an exoprotein produced by S. aureus found in the value. The inventors of '554 found that their compounds could used to inhibit exoprotein production by S. aureus without significantly imbalancing the natural flora present in the vaginal tract. 15 No where in the '554 reference is killing of S. aureus bacteria taught or suggested as a desired method of controlling exoprotein production. As such, one lelled in the art would not, and could not, be motivated to use the compounds of the '777 reference in the absorbent devices of '554, specifically

¹⁴ See U.S. 5,618,554 at column 2, line 8-13.

designed to inhibit exoprotein production by S. aureus without killing the bacteria.

Additionally, while the '554 ref once generally teaches that their nitrogen containing compours may employ additional active materials such as supplementar intimicrobials, antiparasitic agents, antiprur tics, astrogents, local anaesthetics, or anti-inflammatory agents, local anaesthetics, or anti-inflammatory agents is it taught or suggested to use an antibacterial to it! S. aureus bacteria.

As such, the '554 reference fails to rovide a reason why one skilled in the art would choose benzame the disclosed in '777 as the additional antibacterial over any of the numerous antibacterials disclosed essewhere in the art.

As noted above, the '777 referents is directed to improving the bactericidal action of hexachloro tene by combining hexachlorophene with other antibacter at compounds, specifically, in one embodyment, with tenzamide. No where in the '777 reference is it disclosed to use the antibacterial composition, specifically benzamide, or the inhibition of exoprotein production in and around to vagina. Furthermore, no where is it disclosed in '777 that the intibacterial benzamide would be safe to use internally in humans. As such, one skilled in the art would not, and could not, see been motivated to use the '777 composition on an absorbent postrate such as a

¹⁵ See U.S. 5,618,554 at column 3, lin 41-46.

catamenial tampon, which would inevited, and unavoidably, contact the sensitive mucofal membran of the inner vagina.

of the inner vagina. In the instant Office action, the office states that if Applicants' argument is that benzamid vould unavoidably and inevitably harm the sensitive mucosal membrane of the inner vagina, then the same argument should told true for the claimed invention because the instant invention also employs the same benzamide. With all due respect, it seears that the Office has misunderstood Applicants' argument. Applicants' are not asserting that be remide is harmful to the sensitive mucosal membrane of the inn a vagina. Specifically, Applicants' argue that as to where in he '777 reference is it taught or suggested that benzamide or many of its antibacterial compounds are suitable for use in the gina, without the use of Applicants' disclosure as a blueprint which, as noted above, the Federal Circuit has ruled such us improper hindsight reconstruction), there would be no more vation or suggestion to use benzamide in the absorpent devices of '554. As such, there is simply no motivation or suggestion to combine the '554 reference with the '777 reference to live at each and every limitation of claim 1.

As no where has the cited references taught or suggested an exoprotein inhibitor comprising a non-exorbent substrate as required in claims 56-62 and further, there is no motivation or

¹⁶ U.S. 5,618,554 at column 5, lines 5 60.

suggestion to combine the 554 and '755 references to arrive at each and every limitation of claims 55.62, claims 56-62 are patentable over '554 in view of '777.

5. Rejection of Claims for Obv theness-type Double Patenting over U.S. Patent 6,821 199

Reconsideration is requested of the rejection of claims 1, 11, 14-20, and 22-68 under the judicity created doctrine of obviousness-type double patenting in the work of claims 1-4 of U.S. Patent 6,821,999 in view of any one of J.S. Patent Nos. 5,612,045, 5,685,872, or 5,618,554. It particular, the Office has stated that the claims of the insight application are not patentably distinct from the claims of J.S. Patent 6,821,999 because the patented claims are directly in Gram positive bacterial located in and around the raginal by expansing the vaginal bacteria to a vaginal cleansing formulation comprising the open and a second active ingrecient comprising the general formula (II) that includes the first active compounds of the instant claims.

In response thereto, applicants are enclosed herewith a Terminal Disclaimer in accordance wit 37 C.F.R. 1.130(b) and 37 C.F.R. 1.321(c) to obviate the reject in. Accordingly, Applicants respectfully request the obviousness-type double patenting rejection be withdrawn.

In view of the above, Applicants respectfully request favorable reconsideration and allowants of all pending claims. The Commissioner is hereby authorized to charge any fee

deficiency in connection with this Letter To Patent And Trademark Office to Deposit Account N ber 19-1345 in the name of Senniger Powers.

Respectfully Embmitted,

Goff, Reg. No. 41,785
